Seed Financing Round — Q4 2026

Ty-Code: The Sovereign AI Coding Environment

Local-First. Zero-Telemetry. Unbounded Intelligence.

- The first truly local-first, zero-telemetry agentic AI desktop IDE.
- Eliminating $20/month seat taxes, cloud lock-in, and IP exfiltration.
- Empowering 30M+ developers worldwide with sovereign compute.
- Unlocking 1.3B+ free monthly tokens across 11 autonomous runtime harnesses.

The Fatal Flaws of Cloud AI IDEs

Three Critical Vulnerabilities in First-Generation Tools

- Proprietary codebases and credentials uploaded to external multi-tenant cloud servers.
- High recurring subscription markups, artificial rate limits, and zero compute sovereignty.
- Unannounced model deprecations and third-party cloud outages that completely freeze engineering pipelines.
- 82% of regulated enterprises in healthcare, defense, and finance strictly prohibit cloud-connected AI coding tools.

The Solution: Sovereign Agentic Development

Complete Architectural Inversion: Code Never Leaves Local RAM

- Repo indexing, AST parsing, and terminal execution run 100% on local hardware.
- No source code, prompt content, or telemetry ever leaves the machine.
- API keys encrypted using OS-level (Windows DPAPI, macOS Keychain, Linux Secret Service).
- Direct wholesale model routing, or 100% offline execution with local Ollama and private VPCs.

Market Opportunity: The $30B Sovereign Shift

Rapid Developer Adoption Meets the Enterprise Compliance Wall

- adopting autonomous AI coding workflows in 2026.
- driven by the transition from passive autocomplete to multi-file agentic swarms.
- Healthcare, finance, and defense demand verifiable local compliance.
- The fastest-growing budgets in AI tooling are enterprise teams currently blocked by cloud compliance risks.
- Developers demand transparent, usage-based compute over rigid, markup-heavy SaaS seats.

The Product: Built for Terminal Velocity

Modern Engineering Velocity with Zero Cognitive Overhead

- Built on Monaco Editor with native VS Code keybindings, LSP, and extensions.
- Matrix decode animation running at 140 chars/sec with zero UI jitter or layout shifts.
- Bidirectional visual UI canvas syncing directly with production React & Tailwind code.
- Autonomous agent execution with real-time environment scrubbing and command allowlisting.

Tech Moat #1: Omni-Orchestrator & Unified Gateway

Dynamic Health Probes, Rate Forecasting, and Resilient Routing

- Normalizes 60+ AI providers into a single, standardized, reactive Server-Sent Events stream.
- Real-time ping probes, quota forecasting, and automated jitter-backoff algorithms.
- Automatically migrates across models mid-generation without losing conversational context.
- Automatically selects the fastest and most cost-effective compliant model for each specific subtask.

Dedicated Architecture: Failover Chain

```
graph TD
    A[User Prompt / Agent Turn] --> B[Unified ProviderGateway]
    B --> C{Health & Quota Monitor}
    C -->|Healthy| D[Primary Provider: Anthropic / OpenAI]
    C -->|HTTP 429 / Throttled| E[48ms Zero-Drop Failover Bus]
    E --> F[Fallback Provider: Groq / OpenRouter / Ollama]
    D --> G[Preserved Context Stream -> Monaco Editor]
    F --> G
```

- Sub-50ms failover without resetting agent state.
- Proactive rate limit avoidance before HTTP errors occur.

Tech Moat #2: Context Engine & Correction Memory

Local Compounding Intelligence That Remembers Your Stack

- Local SQLite WAL engine that persistently codifies developer instructions and rules.
- Rules learned in conversational chat are automatically enforced across Debugger and Canvas.
- Multi-threaded static analysis workers detect architectural drift, security risks, and regressions before PRs.
- The IDE becomes exponentially smarter and more attuned to the user's specific codebase over time.

The Secret Weapon: 1.3B+ Free Tokens

Zero-Friction Multi-Harness Onboarding with No Credit Card

- Over 1.3 billion free monthly tokens available immediately upon install with no API keys or credit cards required.
- Native routing across 11 developer runtimes including Claude Code, Codex, VS Code, and Cline.
- Developers start coding immediately without configuring cloud billing or payment methods.
- Hardened binary loopback architecture with automated filtering of high-risk scraping endpoints.

Dedicated Architecture: 11-Harness FCC Routing Map

```
graph TD
    subgraph Client [Ty-Code Desktop Client]
        IDE[Monaco Editor & Sidecar]
        ROUTER[Multi-Harness Router]
    end
    subgraph Runtimes [11 Supported Runtime Harnesses]
        H1[Claude Code]
        H2[Codex]
        H3[VS Code API]
        H4[Pi & OpenCode]
        H5[Cline & Aider]
        H6[Hermes, DeepSeek, Grok, Mistral]
    end
    subgraph Supply [FCC Reverse Proxy Layer - Port 8765]
        PROXY[Local Loopback Supply Adapter]
        POOL[1.3B+ High-Throughput Free Token Pool]
    end
    IDE --> ROUTER
    ROUTER --> H1 & H2 & H3 & H4 & H5 & H6
    H1 & H2 & H3 & H4 & H5 & H6 --> PROXY
    PROXY --> POOL
```

- 11 harnesses multiplexed over a secure local port.
- Zero-friction compute without multitenant SaaS lock-in.

Strategic Open-Source Foundation: FCC Credit

Built on Open Innovation, Not Corporate Walled Gardens

- Architected upon the reverse-proxy foundations established by

.

- https://github.com/Alishahryar1/free-claude-code.git
- We didn't build a wrapper; we integrated the best open-source routing available.
- *Free-model supply layer powered by free-claude-code (FCC) — AGPL-3.0 / MIT.*
- Adapted FCC's mock-free binary loopback into a sandboxed, ToS-compliant desktop supply engine.

Business Model & Superior Unit Economics

Zero Token COGS Subsidy Yields 90%+ Software Gross Margins

- Free multi-harness compute + unlimited local Ollama. Zero user acquisition cost.
- Power-user orchestration, multi-agent swarms, encrypted cross-device workspace sync.
- Centralized MDM governance, VPC gateway enforcement, HIPAA/SOC2 audit packages, priority SLA.
- 0% token COGS subsidy—users bring their own keys or leverage open-source free pools, yielding 90%+ SaaS gross margins.

Go-To-Market Strategy: The Sovereign Flywheel

Product-Led Growth Transitioning into High-ACV Enterprise Land-and-Expand

- Instant zero-setup onboarding drives viral adoption across developer communities.
- Individual engineers in banking, health, and defense introduce Ty-Code as the only tool permitted by corporate security.

- Transparent security architecture and FCC open-source integration build deep developer advocacy.
- Convert internal organic developer teams into multi-thousand seat enterprise contracts.

The Team: Systems Architects & Security Engineers

Deep Systems Pedigree in Electron Isolation and Compilers

- Built by experienced systems architects with deep backgrounds in Electron sandboxing, compilers, and LLM orchestration.
- Proven track record in high-throughput network streaming, C++ native bindings, and cryptographic hardware integration.
- Backed by leading figures in enterprise cybersecurity, open-source governance, and developer tooling.
- Delivered production-ready v1.0.0 desktop release, M3E Canvas, and 11-harness routing in record time.

The Ask: $3.5M Seed Round

Scaling Enterprise Engagements and Accelerating Sovereign R&D

- Raising to scale enterprise sales and accelerate sovereign agentic R&D.
- Multi-agent swarms, local model compilation, and low-latency IPC optimizations.
- SOC2 Type II, HIPAA compliance packages, and Microsoft Intune/Jamf integrations.
- Independent penetration tests, bug bounty programs, and open-source hackathons.

- 250,000+ active developers, $4.2M ARR, and 50+ regulated enterprise deployments.
