Ty-Code Marketing Website: Complete Landing Page Copy & Wireframe Guide

MKT-LANDING-2026-V1
Individual Developers, Technical Founders, and Engineering Leads
Punchy, high-conversion, modern B2B/developer SaaS, uncompromisingly privacy-centric
Obsidian Cyber Dark Mode, glassmorphism card surfaces, emerald-green decode frontiers, and responsive interactive grids.

---

1. Hero Section

> [UI / Visual Concept]
> Split-screen hero layout. Left: High-impact typography with glowing emerald badge pill and dual CTA buttons. Right: High-fidelity interactive desktop mockup showing the Monaco editor split with the M3E Canvas and Chat Sidecar, displaying real-time green Decode-Frontier streaming at 140 chars/sec into an Obsidian dark theme.

Badge Pill

`⚡ v1.0.0 Stable Release • Zero-Telemetry Certified • 100% Local-First`

H1 Headline

Local-First AI Coding.

Zero Cloud Exfiltration.

Subheadline

Build at terminal velocity with an autonomous AI IDE that never phones home with your proprietary source code. Powered by our intelligent and a unified unlocking across 11 multi-harness runtimes.

Primary CTAs

- `Download for Free (v1.0.0)`
  Sub-label: Windows • macOS • Linux • No credit card required
- `View Enterprise Architecture →`
  Direct link to technical whitepaper and audit traces

Micro-Social Proof Bar

> [UI / Visual Concept]
> Monochrome SVG partner/ecosystem icons scrolling on infinite marquee: `Monaco Editor` • `Electron 30` • `TypeScript` • `OpenRouter` • `Ollama` • `Groq` • `Anthropic` • `free-claude-code`.
> *Trusted by security-conscious developers, fintech teams, and healthcare engineers worldwide.*

2. The Problem vs. The Ty-Code Solution

> **[UI / Visual Concept]**
> High-contrast side-by-side comparison matrix. The left column uses muted crimson styling with warning icons representing legacy cloud-locked IDEs. The right column uses vibrant cyan/emerald accents and checkmarks highlighting Ty-Code's local-first architecture.

Section Eyebrow

`THE STATE OF AI IDES`

Section Headline

Stop Renting Your Intelligence. Own Your Development Stack.

Dimension	Legacy Cloud-Locked IDEs (Cursor, Copilot, Windsurf)	The Ty-Code Local-First Architecture
	Streams your proprietary code, ASTs, and file trees to multitenant SaaS servers.	. All AST parsing, repo indexing, and terminal execution stay on your local hardware.
Pricing & Cost Scaling	$20/month subscription markups with artificial rate limits and surprise credit expirations.	**Bring-Your-Own-Key (BYOK)**. Pay wholesale model rates directly to providers, or run 100% free with local LLMs.
	Plaintext config files and browser cookies vulnerable to credential harvesters.	. Keys are cryptographically sealed by Windows DPAPI, macOS Keychain, and Linux Secret Service.
Model Availability	Hard vendor lock-in; unannounced model downgrades and pipeline-breaking cloud outages.	**Omni-Orchestrator**. Health-aware dynamic failover automatically pivots across 100+ models without dropping context.
	Ceases functioning the moment internet connectivity drops or cloud APIs hit throttling.	. Runs completely offline with local Ollama, vLLM, or private VPC gateway endpoints.

---

3. Feature Showcase: The "Why Ty-Code" Grid

> [UI / Visual Concept]
> 2x2 Bento-box layout. Each card features subtle backdrop blur (`backdrop-filter: blur(12px)`), interactive hover glow, an animated SVG micro-diagram, and a live code/UI snippet preview.

Card 1: The Omni-Orchestrator

> [Icon: Interconnected Adaptive Circuit Nodes / 🌐]
> [Visual: Animated routing diagram demonstrating dynamic failover from an overloaded provider to Groq in 48ms without conversation reset.]

Headline: Intelligent Routing That Never Drops Context.

Tired of hit-the-wall HTTP 429 rate limits and random upstream provider outages mid-refactor?
Our dynamically monitors model health, token quotas, and latency across OpenRouter, Groq, Anthropic, and local Ollama.
If a provider hiccups, Ty-Code seamlessly resumes your turn on an alternate model with zero context loss.

Card 2: The Context Engine & Correction Memory

> [Icon: Synaptic Memory Network / 🧠]
> [Visual: A live notification toast: "🧠 Rule learned: 'Never use var, use const'. Applied across Chat, Debugger, and Canvas."]

Headline: The AI That Learns Your Stack and Remembers Your Rules.

Generic AI assistants forget your architectural preferences the moment you clear your chat history.
Ty-Code's codifies every developer correction into a local Write-Ahead-Logged SQLite database.
Rules taught in the Chat Sidecar are instantly enforced by the architectural debugger and visual canvas in real time.

Card 3: The Omni-Debugger

> [Icon: Diagnostic Shield with Layered Radar / 🔍]
> [Visual: Split-panel showing real-time drift detection flagging a SQL injection risk and outdated pattern alongside an instant one-click patch preview.]

Headline: Stack-Aware Architectural Drift Detection.

Catch hidden bugs, schema mismatches, and compliance violations before your code ever hits pull request review.
The runs multi-threaded static workers to inspect file mutations against your workspace's actual architecture.
It identifies drift, isolates failing unit tests, and proposes atomic unified diffs you can verify with a single keystroke.

Card 4: The M3E UI Canvas

> [Icon: Interactive Vector Artboard & Pen Tool / 🎨]
> [Visual: Live interactive split showing a React component visually manipulated on the canvas while clean Tailwind code updates synchronously in Monaco.]

Headline: Project-Native Visual UI Generation.

Bridge the gap between frontend design and production code without leaving your IDE.
The extracts your project's active design system tokens, Tailwind palettes, and CSS variables directly from source.
Design components visually on an interactive canvas and watch bidirectional code synchronize instantly with Monaco.

🌟 Open-Source Credit & Acknowledgement

Ty-Code's multi-harness routing capability was deeply inspired by and architected upon the pioneering methodologies established by the project:

> **Repository:** https://github.com/Alishahryar1/free-claude-code.git
> **Permanent Licensing Attribution:** *Free-model supply layer powered by free-claude-code (FCC) — AGPL-3.0 / MIT — https://github.com/Alishahryar1/free-claude-code*

By adapting FCC's mock-free binary loopback architecture into Ty-Code’s hardened enterprise sandbox, we engineered a 100% Terms-of-Service-compliant, voice-supported, and session-aware supply layer.
This open-source breakthrough allows developers to build, test, and iterate without spending a single dollar on initial token budgets.
It stands as definitive proof that community-driven open innovation builds superior, more resilient developer tools than closed corporate gardens.

5. Enterprise Security & Compliance

> [UI / Visual Concept]
> Enterprise security dashboard badge grid. Four cryptographic security shield cards detailing technical protocol compliance, alongside a downloadable link to our audited machine-readable test artifacts.

Section Eyebrow

`ENTERPRISE GRADE DATA SOVEREIGNTY`

Section Headline

Engineered for Healthcare, Defense, and Regulated Engineering.

```
+-----------------------+  +-----------------------+  +-----------------------+  +------------
|    🔒 Zero-Telemetry   |  |   🛡️ 3-Tier Sandbox    |  |     🏥 HIPAA & SOC2    |  |    ✈️ Air-
| No AST or code egress. |  | PTY env scrubbing &    |  | Meets strict non-      |  | Fully offlin

+-----------------------+  +-----------------------+  +-----------------------+  +------------
```

Technical Security Pillars:

1. Because Ty-Code never routes repository files to external indexing servers, your compliance perimeter remains strictly confined to your managed hardware.
2. Automated agent commands run under strict allowlist policies with aggressive PTY environment scrubbing that strips API keys and secrets before execution.
3. All credentials remain locked in operating-system secure storage ( ), preventing token theft from compromised local dependencies.
4. IT security teams can deploy global policy configurations via Microsoft Intune, Jamf, or GPO to enforce private LLM VPC endpoints across 1,000+ engineers.

6. Call To Action: Ready to Take Back Control?

> [UI / Visual Concept]
> Immersive banner with animated subtle matrix code rain in the deep background. Prominent download buttons with automatic OS detection and copyable terminal quick-start commands.
